

Always store your iSUP in the shade when not in use. Warm air/direct sunlight expands the air in your board, which increases the pressure.

If the pressure is too high, then this may cause your board to explode or the seams to open. In warm weather, we recommend to inflate your board by 2-3PSI less than usual. For most users, 15psi is sufficient, heavier riders may want to inflate to 18PSI for increased stiffness in normal weather conditions.
